BloApCo Expands Product Portfolio with Launch of Titan Series Recycling Equipment Line

GERMANTOWN, WI (May 6, 2026) — Blower Application Company (“BloApCo”) is proud to announce the launch of the Titan Series, a powerful new line of industrial shredders and granulators that significantly expands the company’s capabilities in the recycling and material processing markets. Powered by BloApCo, the Titan Series introduces a new generation of high-performance equipment designed to serve a broader range of materials, industries, and applications than ever before.

The Titan Series includes double-shaft shredders, single-shaft shredders, and high-speed granulators, providing BloApCo customers with versatile size-reduction solutions and a comprehensive product portfolio. The new line enables BloApCo to enter high-growth markets and support customers across a wider range of recycling and industrial processing needs.

“The Titan Series represents an exciting evolution for BloApCo and a major step forward in our long-term growth strategy,” said Frank Tejera, Chief Executive Officer of BloApCo. “By expanding into new recycling applications and introducing equipment that complements our legacy shredding solutions, we are opening the door to new markets while delivering the same performance, reliability, and customer support our partners have come to expect from the BloApCo name.”

Engineered for durability and performance, Titan Series equipment is designed for demanding recycling environments and can process an extensive variety of materials including plastics, metals, wood, tires, rubber, electronic waste, textiles, wire, paper, medical waste, and municipal solid waste. The line also supports specialized applications such as pipe shredding, bulky waste reduction, and secondary granulation.

Key features across the Titan Series include low-speed, high-torque shredding technology engineered to maximize efficiency and long-term durability in demanding processing environments, along with multiple rotor, blade, and screen configurations that can be tailored to specific materials and application requirements. The line also offers hydraulic feed and drive options to improve throughput and deliver enhanced torque for more challenging materials. Built with heavy-duty construction for continuous

industrial use, every Titan Series machine is designed to withstand rigorous operating conditions while maintaining reliable performance. Additional customization is available through BloApCo's proprietary control systems and integrated support solutions, and each unit is backed by a one-year warranty along with BloApCo's trusted service, parts, and aftermarket support network.

Available in a wide range of machine sizes and horsepower configurations, the Titan Series gives customers the flexibility to select equipment precisely matched to their throughput, material, and operational requirements. Models range from compact systems for specialized processing to heavy-duty industrial shredders and granulators built for the toughest applications.

Importantly, the Titan Series is an important extension of the BloApCo portfolio; each machine is built to meet the company's high standards for quality, reliability, and long-term performance. Every Titan Series machine is powered by BloApCo's engineering, parts, service, and aftermarket teams, delivering the same trusted customer experience that has defined the company for decades.

With the launch of the Titan Series, BloApCo further strengthens its position as a comprehensive solutions provider in the industrial recycling equipment market, equipping customers with more ways to process more materials, in more markets, than ever before.

The Titan Series is set to launch in May 2026, with live demonstrations planned for later this year.

About BloApCo

For over 90 years, Blower Application Company ("BloApCo") has been the industry leading manufacturer of waste-handling equipment and integrated systems, used and trusted in the broadest range of applications. BloApCo products hold an excellent reputation for reliability, durability, endurance, performance and quality, and are known to run longer at higher performance standards, drastically reducing customer downtime and maintenance costs.
